

## International tournament of Young Mathematicians

24<sup>th</sup> June – 1<sup>st</sup> July 2010  
University Paris-Sud 11, Orsay,  
France

**Team:**  
Bulgaria

**Problem:**  
9. A Topological Problem

### Abstract

Problem 9. is examined in details. The following results are reached:

9.1. Answer: 3

9.2. a) It is shown that  $\text{int}(\text{conv}(A)) = \text{int}(\text{conv}(\text{cl}(A)))$  holds true. 9.2.

b) Answer: 8

9.3. Answer: 8.

We used a method for the solution of this problem which exhausts all possibilities. Therefore, this method exhausts all cases of the problem.

## Theoretical Part

1. Closed set, without the points on the boundary, is an open set.
2. *Interior* – the operation removes the boundary of the set (these objects from the set, which have less than  $n$  dimensions disappear).
3. *Closure* – adds the boundary of the set.
4. *Convex cover* – for a set of points  $A$  is the minimal convex set containing  $A$ .

## Solution

### Problem 1.

$A$  consists closed and also opened sets (and some more, which are neither opened, nor closed).

$int(A)$  and  $cl(A)$  change only the boundary of  $A$ .

But  $A$ ,  $int(A)$  and  $cl(A)$  are different.

$$int(int(A)) = int(A)$$

$$int(cl(A)) = int(A)$$

$$cl(int(A)) = cl(A)$$

$$cl(cl(A)) = cl(A)$$

No matter how the operations are arranged, we obtain  $int(A)$  or  $cl(A)$  (only if we have made at least one operation).

I.e. the sets are  $A$ ,  $int(A)$  i  $cl(A)$  - 3 sets.

Example:  $A = [0; 1)$

## Problem 2.

a)

$$\text{int}(\text{conv}(A)) \neq \emptyset \Rightarrow$$

We can contend that the convex cover of  $A$  has area because  $\text{int}(A)$  removes the boundary and we obtain something more than empty set.

$\text{conv}(A)$  and  $\text{conv}(cl(A))$  [eventually] are different only by their boundary (because if  $A$  is closed,  $cl(A)$  doesn't change it) and when we apply  $\text{int}(\text{conv}(A))$  and  $\text{int}(\text{conv}(cl(A)))$ , we remove the boundary (if it exists) and consequently obtain the same set, i.e.  $\text{int}(\text{conv}(A)) = \text{int}(\text{conv}(cl(A)))$  - Q.E.D.

b)

$$\text{If } \text{int}(\text{conv}(A)) = \emptyset,$$

Then, since  $\text{int}$  removes the boundary, we have that  $\text{conv}(A) \in \mathbb{R}$ , i.e. we return the case to the previous problem, but with the operation  $\text{conv}$ .

Then, the possible sets are  $A, \text{int}(A), cl(A)$

If  $\text{int}(\text{conv}(A)) \neq \emptyset$ , we have:

(the operations only with  $\text{int}$  and  $cl$  follow directly by the previous problem)

1)  $\text{int}(\text{int}(\text{int}(A))) = \text{int}(A)$  [from the previous problem];

2)  $\text{int}(\text{int}(cl(A))) = \text{int}(A)$  [from the previous problem];

3)  $\text{int}(\text{int}(\text{conv}(A))) = \text{int}(\text{conv}(A))$ , because  $\text{int}(\text{int}(B)) = \text{int}(B)$ ;

4)  $\text{int}(cl(\text{int}(A))) = \text{int}(A)$  [from the previous problem];

- 5)  $\text{int}(\text{cl}(\text{cl}(A))) = \text{int}(A)$  [from the previous problem];
- 6)  $\text{int}(\text{cl}(\text{conv}(A))) = \text{int}(\text{conv}(A))$ , because  $\text{int}(\text{cl}(B)) = \text{int}(B)$ ;
- 7)  $\text{int}(\text{conv}(\text{int}(A))) = \text{conv}(\text{int}(A))$ , because after  $\text{int}(A)$  the convex cover  $\text{conv}(\text{int}(A))$  don't have a boundary to be removed;
- 8)  $\text{int}(\text{conv}(\text{cl}(A))) = \text{int}(\text{conv}(A))$ , because even we add the boundary with  $\text{cl}$ , after that  $\text{int}$  removes it;
- 9)  $\text{int}(\text{conv}(\text{conv}(A))) = \text{int}(\text{conv}(A))$ , because  $\text{conv}(\text{conv}(B)) = \text{conv}(B)$ ;
- 10)  $\text{cl}(\text{cl}(\text{int}(A))) = \text{cl}(A)$  [from the previous problem];
- 11)  $\text{cl}(\text{cl}(\text{cl}(A))) = \text{cl}(A)$  [from the previous problem];
- 12)  $\text{cl}(\text{cl}(\text{conv}(A))) = \text{cl}(\text{conv}(A))$ , because  $\text{cl}(\text{cl}(B)) = \text{cl}(B)$ ;
- 13)  $\text{cl}(\text{int}(\text{cl}(A))) = \text{cl}(A)$  [from the previous problem];
- 14)  $\text{cl}(\text{int}(\text{int}(A))) = \text{cl}(A)$  [from the previous problem];
- 15)  $\text{cl}(\text{int}(\text{conv}(A))) = \text{cl}(\text{conv}(A))$ , because  $\text{cl}(\text{int}(B)) = \text{cl}(B)$ ;
- 16)  $\text{cl}(\text{conv}(\text{int}(A))) = \text{cl}(\text{conv}(\text{int}(A)))$  [from the previous problem];
- 17)  $\text{cl}(\text{conv}(\text{cl}(A))) = \text{cl}(\text{conv}(A))$ , because never mind, in the end of the operations we take the boundary of  $A$ ;
- 18)  $\text{cl}(\text{conv}(\text{conv}(A))) = \text{cl}(\text{conv}(A))$ , because  $\text{conv}(\text{conv}(B)) = \text{conv}(B)$ ;

- 19)  $\text{conv}(\text{conv}(\text{int}(A))) = \text{conv}(\text{int}(A))$ , because  $\text{conv}(\text{conv}(B)) = \text{conv}(B)$ ;
- 20)  $\text{conv}(\text{conv}(\text{cl}(A))) = \text{conv}(\text{cl}(A))$ , because  $\text{conv}(\text{conv}(B)) = \text{conv}(B)$ ;
- 21)  $\text{conv}(\text{conv}(\text{conv}(A))) = \text{conv}(A)$ , because  $\text{conv}(\text{conv}(B)) = \text{conv}(B)$ ;
- 22)  $\text{conv}(\text{int}(\text{int}(A))) = \text{conv}(\text{int}(A))$ , because  $\text{int}(\text{int}(A)) = \text{int}(A)$ ;
- 23)  $\text{conv}(\text{int}(\text{cl}(A))) = \text{conv}(\text{int}(A))$ , because  $\text{int}(\text{cl}(A)) = \text{int}(A)$ ;
- 24)  $\text{conv}(\text{int}(\text{conv}(A))) = \text{int}(\text{conv}(A))$ , because  $\text{conv}$  dava gives convex cover,  $\text{int}$  removes the boundary and after that we take the convex cover, i.e. after  $\text{conv}$  and  $\text{int}$  one more time  $\text{conv}$  doesn't change the set;
- 25)  $\text{conv}(\text{cl}(\text{int}(A))) = \text{conv}(\text{cl}(A))$ , because  $\text{cl}(\text{int}(A)) = \text{cl}(A)$ ;
- 26)  $\text{conv}(\text{cl}(\text{cl}(A))) = \text{conv}(\text{cl}(A))$ , because  $\text{cl}(\text{cl}(A)) = \text{cl}(A)$ ;
- 27)  $\text{conv}(\text{cl}(\text{conv}(A))) = \text{cl}(\text{conv}(A))$  - analogical to 24);

Consequently the possible outcomes are the following:

$$\begin{array}{c}
 \text{int}(A) \\
 \text{int}(\text{conv}(A)) \\
 \text{conv}(\text{int}(A)) \\
 \text{cl}(A) \\
 \text{cl}(\text{conv}(A)) \\
 \text{cl}(\text{conv}(\text{int}(A))) \\
 \text{conv}(\text{cl}(A))
 \end{array}$$

$conv(A)$

Answer: 8.

### Problem 3.

The answers for  $n > 2$  are analogical to the previous problem (9.2.b) because the operations *int*, *cl* and *c conv* work only with the boundary. Whatever operations we apply (it doesn't matter the order) we get the same sets as in the previous problem (9.2.b).

Answer: 8.
